

FOR IMMEDIATE RELEASE

Huntsville electronics preparation firm gains advanced aerospace and commercial registrations

Huntsville, Alabama. March 1, 2010. Tintronics, a Huntsville, Alabama-based company supporting the national electronic manufacturing industry, is now certified to provide AS9100 REV B and ISO9001:2008 level services to its customers.

Tintronics has provided tinning and tin mitigation services to myriad private and aerospace customers since its formation in 1988. These services prepare the tiny electronic parts used in modern electronics so that they can be assembled by automated means and to ensure that they work properly in the consumer, industrial and military applications they serve. The new registrations allow the company to compete for more critical and demanding projects, expanding its prospects for business. The AS9100 REV B registration will allow the company access to more aerospace business, while the ISO9001:2008 registration will position Tintronics for a higher level of consumer and industrial electronics work.

“We have the registrations in our hands right now” says Alan Goldberg, the company’s president. “This is not so much a leap for us as the latest in a steady acquisition of higher levels of competency for our customers. With the new capabilities will come new business and better products for everyone from the home user to the military. Add to this our new ultra-precise robotic hot-solder dip capability, and you’re going to see us take on a whole new set of projects and business. We will be right in the middle of the process-oriented, traceable future the electronics assembly industry is headed for.
